Tissue specificity:

Weakly expressed in most tissues. Strongly expressed in brain, heart, skeletal muscle, kidney and testis..

Subcellular location:

Nucleus.

Function:

Responsible for the deacetylation of lysine residues on the N-terminal part of the core histones (H2A, H2B, H3 and H4). Histone deacetylation gives a tag for epigenetic repression and plays an important role in transcriptional regulation, cell cycle progression and developmental events. Histone deacetylases act via the formation of large multiprotein complexes..
